

6. Conclusion – By Ali

We created a revolutionary software that will be very helpful to all people. The reason why it is revolutionary is because our application makes an everyday task a lot easier than before. Also, our application isn't directed towards a particular group of people but rather the entire population since everybody needs to do grocery shopping. In conclusion, we created an application that uses real time store data to get a best-path for the items the user chose. A lot of research and debate went into making this project; and because of all that discussion, the team did not need to make a lot of changes. There were still couple of things that were changed. The main thing we changed is the number of personnel needed. Initially, we thought that 2 developers would be enough for the entire project but as we did our research, we realized that we were wrong. We added a project manager, a UI/UX designer and a QA tester which increased the total cost. Another small thing we changed was that we took out the weekends from the schedule after we realized that working on the weekends was not a good practice. In the end, we created an application that was in line with our initial predictions.
