

4.

The process model employed in this project is the prototyping model. The reason being is that it makes the most sense for the work that we are doing for the class and for future iterations. Our project is iterative for the class. We work in a group and get feedback from our professor and make changes based on feedback. We are first communicating, by meeting with group members and getting professor feedback on the scope of the project making the necessary changes. To showcase the project we may not have a working app but it will be a prototype showcasing the use cases of the app to get feedback. This is a prototyping process as we are getting feedback at each stage and making changes based on that feedback. This process makes the most sense for this type of project compared to the other process models.
